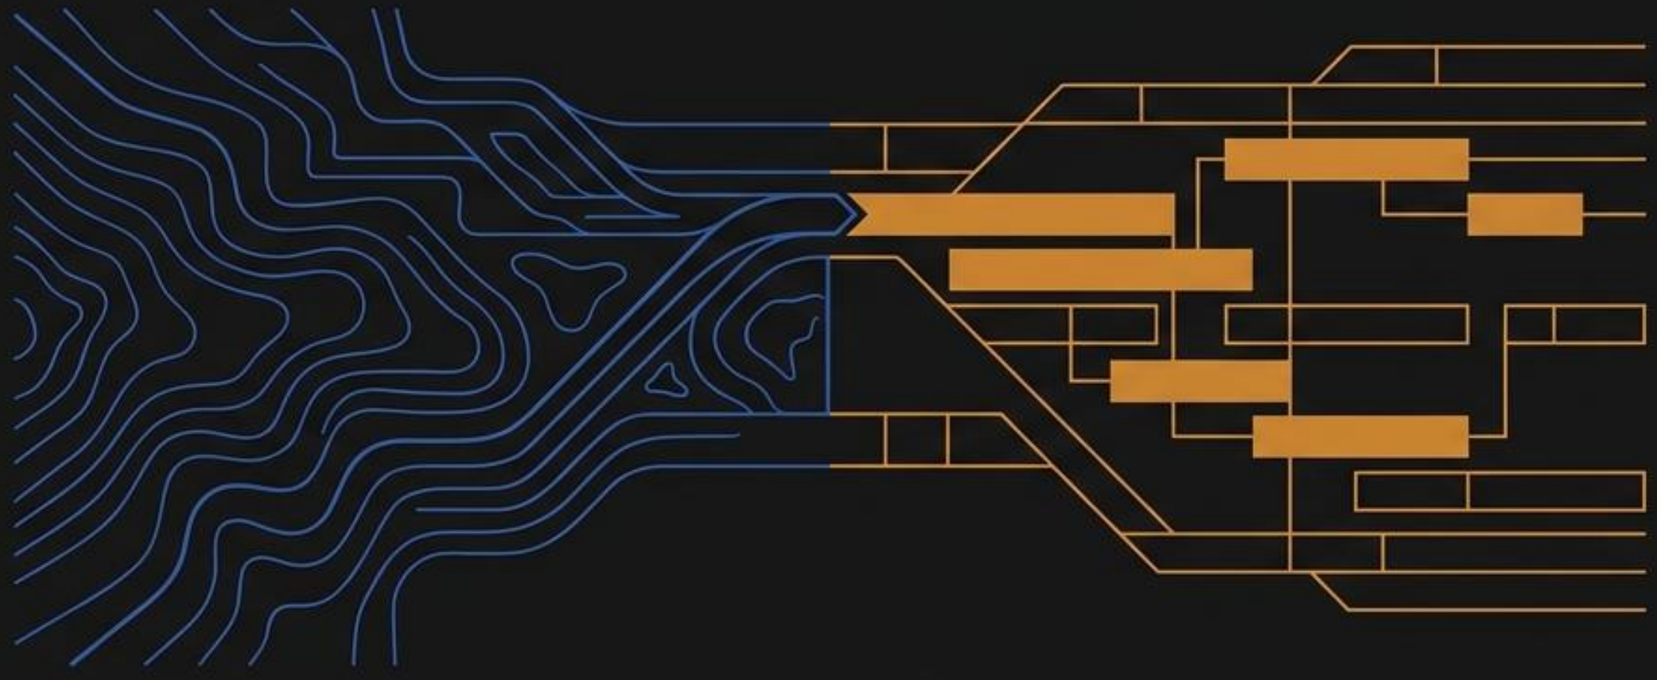
Gateway to Local Discovery. Global Network Management.

ChargeAtlas

The Comprehensive EV Charging Ecosystem



The Ecosystem

The Driver's Dilemma

Need reliability, transparent pricing, and seamless trip integration.

Currently facing range anxiety, fragmented apps, and hidden costs.

The Operator's Bottleneck

Need network control, maximized uptime, and dynamic profitability.

Currently facing disconnected hardware, manual incident incident management, and static pricing limitations.

Gateway to Local Discovery

Precision Filtering

Native search capabilities filtering by city, connector type, power output, live availability, operator, and nearby amenities (using bounding box parameters).

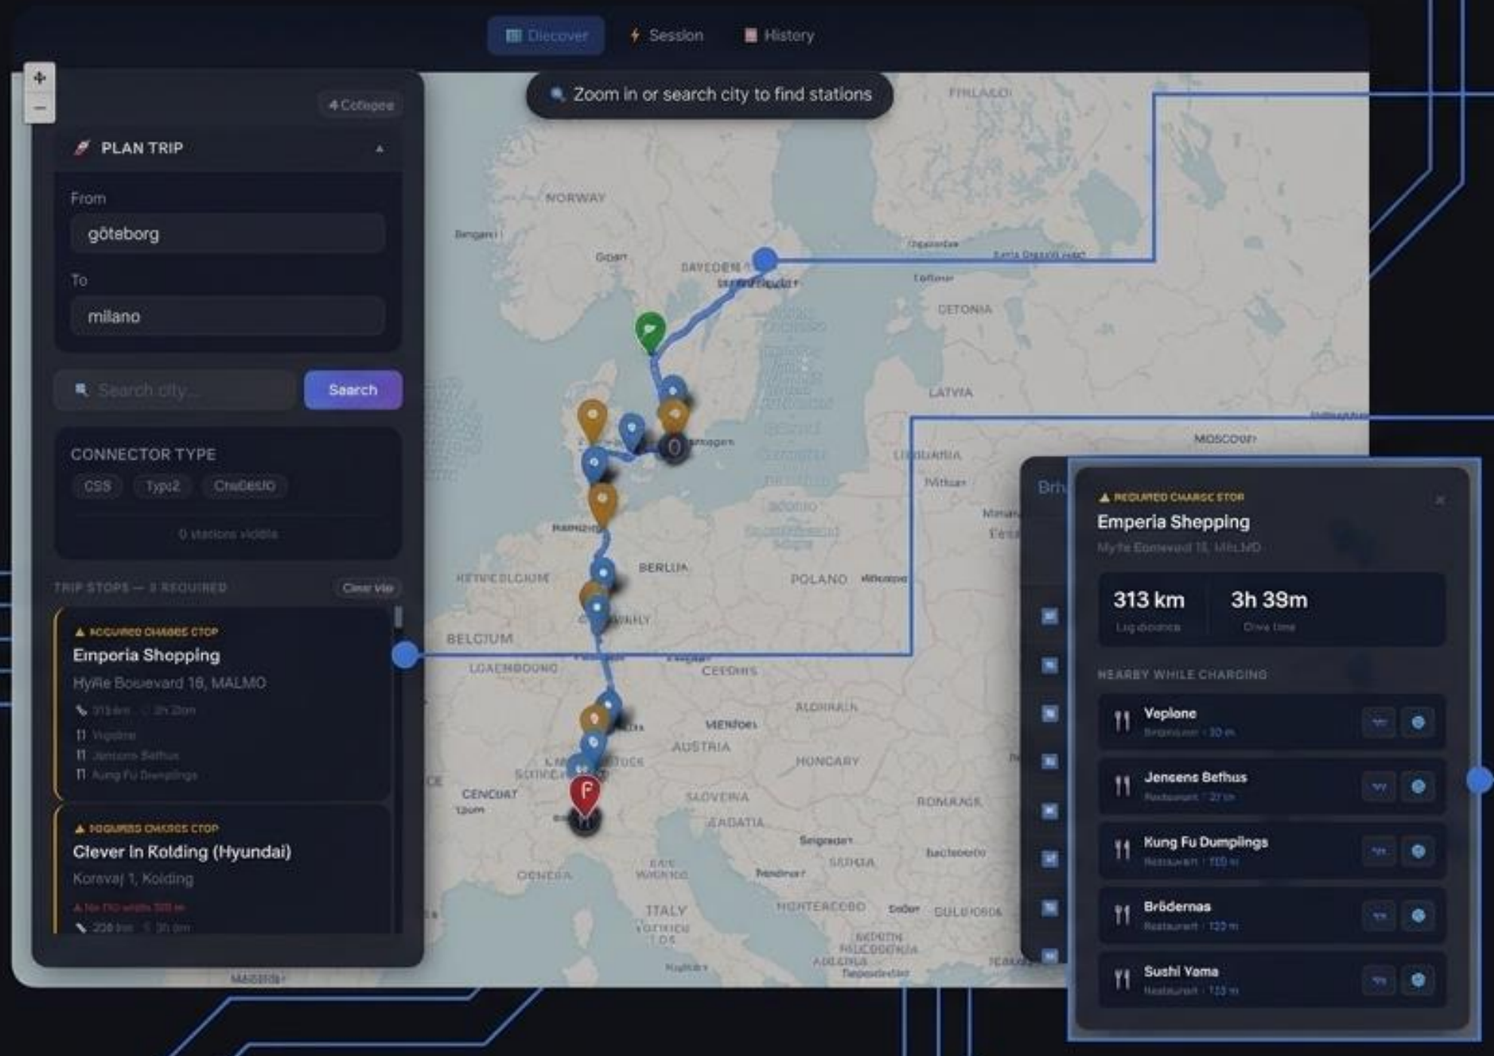
On-Demand Ecosystem

If local search yields zero results, the system automatically executes an on-demand OCM (Open Charge Map) fetch to populate the area. Public endpoints allow browsing without requiring authentication.

The Tariff Fallback Chain

Transparent pricing logic that guarantees a valid rate is always displayed. The system checks sequentially: Station-Specific Tariff → Operator Default Tariff → Standard System Fallback.

The Intelligent Routing Engine



CORS-Safe Geocoding & Routing:
Powered by Photon geocoding and OSRM routing via an integrated proxy service.

Battery Emulation:
The EmulationPanel calculates maximum range based on specific car brands and battery states, autonomously injecting mandatory charging stops into the itinerary.

Contextual Overpass POIs:
Surfaces nearby amenities (like Vapiano or Domino's) specifically around the mandated charging stops, optimizing the driver's dwell time.

The Command Center: Operator Control

Command Timeline

Dashboard
High-level KPIs, 30-day trends

Network Management
CRUD operations, EVSEs, Connectors

Tariffs
Dynamic pricing and graceful rules

Incidents
Automated fault resolution

Analytics
Uptime metrics, usage patterns

Demand Meets Supply. Perfectly.

For Drivers: Complete confidence on the open road with intelligent routing, transparent pricing, and live availability.

For Operators: Total command over the network with automated fault resolution, dynamic tariff waterfalls, and robust asset management.

The Result: A resilient, two-sided ecosystem built to scale the future of EV mobility.
